AI stories from Bermuda

Bermuda country edition • Classroom and community reading

Two imagined local cases for readers to discuss. Each turns on a choice someone can make when a tool gives an answer that needs checking.

Where the rain went

Nia put a bowl beneath the edge of the model roof her class had built. When she poured water from a jug, the bowl stayed dry. The picture checker on the tablet had given the roof a green tick.

She lifted the cardboard house and found a wet patch underneath. The little channel meant to carry rain towards the tank pointed the wrong way. From directly overhead, the roof looked perfect.

Nia took a second picture from the side. Then she poured the same amount of water again. This time her class could see the stream enter the bowl. She taped both pictures into her notebook.

> **Discuss.** What did pouring the water show that the first photograph could not?

Two currencies on one page

A review clerk in Hamilton had nearly signed a summary of a storm claim. The draft put a dollar sign beside each figure. It read smoothly, and the totals added up. One invoice had come from a supplier overseas.

The clerk opened the original. The invoice named a different currency from the repair estimate. Nobody had recorded an exchange date. Adding the numbers had produced a sum that meant nothing.

She sent the file back with both documents attached and asked for the currency and date beside every amount. The claimant received a short explanation of the delay. The team kept the example to check the next version of its assistant.

> **Discuss.** Which two pieces of evidence did the reviewer need before adding the figures?
